THE LOOK

Supporting the skin in the eye area is key to maintain a fresh and youthful look

**IT TAKES 3 SECONDS
TO THE BRAIN TO DECIDE
IF SOMEBODY
IS ATTRACTIVE OR NOT.**

- ▶ Eyes are a dominant feature in the process
- ▶ Eyes are a key element in facial recognition
- ▶ Eyes are the window of the soul

EYE AREA AGING PROCESS

WHY DOES THE SKIN AROUND THE EYES AGE QUICKLY?

► **Lack of fat**

Periocular fat pad is the first to disappear as we age

► **Thin skin**

Skin around the eye is naturally thin so loss of collagen will have more consequences on its aspect

HOW DOES THE SKIN AROUND THE EYES CHANGE WITH AGE?

► **Fine lines and wrinkles**

As skin is thinning, fine lines and wrinkles start to show under the mechanical effect of facial expression

► **Dark circles and puffiness**

Dark circle is an optical illusion; as the skin is thinning and the underlying fat is disappearing, the muscle becomes more visible giving a blueish or darkish color on the area

JALUPRO[®]

— YOUNG EYE —

PREFILLED SYRINGE 1ML

7 AMINO ACIDS

collagen stimulation

3 PEPTIDES

Fibroblast activation, collagen protection
and muscle relaxing effect

BI-DENSITY HYALURONIC ACID

the best of hydration without the puffiness

FIRST
INJECTION

1-2 WEEKS

SECOND
INJECTION

1-2 WEEK

INJECTION TECHNIQUE

After numbing and cleaning your eye area, your practitioner will inject **JALUPRO Young Eye** (half of the monouse syringe for each eye) with a very thin needle, covering the whole area.

After the injection, you can experience a bit of redness and small papules. This will dissappear between 30 min and a few hours.

Your practitioner should apply JALUPRO Mask, JALUPRO Serum immediately after the injection.

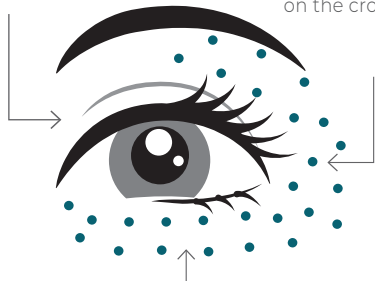

Do not apply any other products or make-up on the area for the rest of the day.

UPPER LID

Superficial micropapules
on the external upper
part of the eye

CROWS FEET

Superficial micropapules
on the crows feet area

LOWER LID

2 lines of Superficial micropapules from tear
through to external lower part of the eye

2 WEEKS

THIRD
INJECTION

1-2 WEEKS

FOURTH
INJECTION

SWELLING AND PUFFINESS IS THE MAIN COMPLICATION OF EYE AREA INJECTION

SOMETIMES IT IS BECAUSE

- ▶ Your lymphatic system is a bit lazy by nature (genetic predisposition, lack of exercise...).
- ▶ You have relaxed your upper face muscles with neuromodulators. Therefore your muscle cannot stimulate your draining system as before.
- ▶ You may have an underlying health condition which makes you prone to edema.
- ▶ You have been injected with fillers in the tear trough area or cheek area.
- ▶ You do not eat a lot of protein.

WHAT SHOULD I DO IN CASE OF SWELLING?

Mild to moderate swelling in the eye area is unfortunate but can happen. It usually disappears in 24h.

- ▶ As a good habit, you should massage the periorbital area in the morning and at night when doing your skin care routine. You can apply cold therapy which stimulates your lymphatic system and microcirculation. Any kind of exercise and breathing, stimulates your lymphatic system and drain your face.

If swelling lasts more than 48h, refer to your practitioner.

JALUPRO RANGE CAN OPTIMIZE EVEN MORE YOUR RESULTS

JALUPRO SUPERHYDRO

TO MAINTAIN YOUR FACE STRUCTURE AND LIFT

It is injected in the retaining ligament to prevent sagging of the face and periorbital area.

JALUPRO SERUM

TO COMPLETE THE EYE TREATMENT
AND IMPROVE RESULTS

Our serum based on Amino Acids and Hyaluronic acid is a perfect post care after Jalupro Young Eye treatment and will even enhance your results as a daily routine for your eye contour skin care.

JALUPRO ENHANCER GEL

TO STRENGTHEN EYELASHES AND EYEBROWS

Our eyelash Enhancer Gel will be the perfect complement to an eye area rejuvenation treatment, perfecting the result by strengthening your eyelashes and your eyebrows.
